Garden *and* Flower Seeds

Alfred J. Brown Seed Co.

25-29 Campau Ave., N. W.

GRAND RAPIDS, MICH.

Bigger and Better Gardens

*B*IGGER and better garden campaigns are getting the attention of wise and thrifty people who are in a position to plant and enjoy the pleasure and profits of a good garden.

Crisp, tender, full flavored vegetables, fresh from your own garden will add much to the pleasure of each meal. As a substitute for golf or other expensive outdoor sports, gardening will give you that healthful exercise in the open air and sunlight.

Seeds, while low in cost, are most important to the success of your garden.

Be Sure to Plant Good Seed

We have a fresh stock of **Tested Seed** well grown by specialists who have had years of experience in producing good seed. They may be depended upon to produce your favorite vegetables and flowers if given ordinary care.

Let us help you plan for a bigger and better garden. Our stocks are very complete. We will consider it a pleasure to serve you.

Select Vegetable Seeds

A garden planted with our selected seeds and properly cultivated will mean a big saving to you. We have listed only those varieties of vegetables that we consider best. A great deal of experimenting and testing was necessary to complete this list and we only add to it when our trial shows that a new variety is worthy.

Asparagus

One ounce will plant about 50 feet of drill, and produce about 200 plants.

This is one of the most delicious of early spring vegetables and should have a place in every home and market garden. Sow seed in early spring, 3 inches apart, in drills 18 inches apart, and cover 2 inches deep. When plants are one or two years old, transplant, setting them as far apart as you can give the space—3 by 2 feet, or 3 by 3 feet is better—at a depth of 6 to 8 inches. Semi-round, black seed. The bed should be deeply dug and well manured. A well made bed will last fifteen to twenty years. Do not cut for two seasons; cut lightly the third season; afterward do not cut for more than six weeks.

Conover's Colossal. A mammoth green sort of finest quality. The standard variety for many years.

Early Giant Argenteuil. A valuable sort on account of its earliness and immense size. It is practically rust-free and produces a large yield of uniform size stalks, which sometimes weigh as much as 4 ounces.

Beans

All varieties of Beans thrive in average garden soil which has been well and deeply dug. They may be planted at intervals all summer for succession, but the first planting should be made as soon as the ground is warm, the bush varieties 2 inches apart, in rows 18 inches apart, and at a depth of 2 or more inches; the pole varieties in hills at least 3 by 3 feet apart each way, 8 or 9 beans to a hill, thinning to 3 or 4 plants when well up. Bush varieties may also be grown in hills 18 inches apart each way, 3 plants to a hill. Beans should be picked when young and tender, but neither picking nor cultivating should be done when plants are wet with dew, as it sometimes causes the leaves to rust.

Yellow or Wax-Podded Bush

One pound will plant about 100 feet of drill.

Round Pod Kidney Wax. A very handsome midseason variety, especially desirable for snaps for the home garden. The plants are of strong growth, spreading, and very productive. Leaves are large, broad, and roughened and pods are long and round, 5½ to 6 inches long, slightly curved, light yellow, waxlike, stringless, and of the very best quality. Seed long, cylindrical, medium sized, nearly white, with a little dark marking about the eye.

Sure Crop Wax. A vigorous growing, very productive variety, similar in general appearance of plant and seed to Currie's Rustproof Wax. The pods, however, are more fleshy, of decidedly better quality, and are stringless at practically all stages of growth. Pods about 6 inches long, nearly round, attractive in color and remain a long time in condition for snaps. Seed long, oval, roundish at ends, medium size, purplish black. A desirable variety for either the home or market garden.

Currie's Rustproof Black Wax. An early variety that is rustproof. The extra long, flat, yellow pods are of excellent flavor. This is one of the best sorts for general use as it is very hardy and a heavy yielder. The dried beans are black.

Davis White Kidney Wax. A fine market and home-garden sort. It is extremely hardy and vigorous and an excellent keeper. The handsome pods are long (6½ to 7 inches), light yellow, straight, and very crisp and tender when young. The clear white Beans are medium large and kidney-shaped.

Prolific Black Wax. This is one of the best varieties for the home garden, being perfectly stringless and of excellent flavor. The clear waxy white pods are of medium size, round, and full. An early and prolific bearer. Dry beans oval and black.

Golden Wax Improved. An excellent market Bean that does not rust. The long, nearly straight pods are flat, broad, golden yellow, and very fleshy; stringless and brittle when young. Dry beans oval, white, with dark mottlings. A heavy yielder.

Pencil Pod Black Wax Beans.

Bountiful Beans.

Yellow or Wax Podded Bush Beans

Pencil Pod Black Wax. One of the best for the home garden. The pencil-like pods, 6 to 7 inches in length, are well rounded and of a beautiful yellow color. The meat is brittle, stringless, and of excellent flavor. Dry beans oval and black.

Wardwell's Kidney Wax. A medium early variety maturing a little later than Improved Golden Wax. It is very productive of long, straight, flat, yellow pods that are stringless and brittle. Its many good qualities have made it a favorite everywhere. Dry beans long, white, with purple mottlings.

Green Podded Bush Beans

One pound will plant about 100 feet of drill.

Black Valentine. An extremely profitable sort for the market grower because of its immense crops of very long, handsome, nearly round, dark green pods. A very hardy and early variety that has been largely planted. Dry beans are oval and black.

Bountiful. An equally good Bean for the market or home garden. It bears continuously and profusely for several weeks and is generally conceded to be one of the best flat, green-podded Bush Beans. The pods are large, solid, and stringless, retaining their tenderness even when past maturity. The earliest of the Bush Beans and also the most popular. Dry beans are long, dark tan color.

Burpee's Stringless. This old variety is steadily growing in popularity, and deservedly so, for it combines hardiness, extreme earliness, and great productiveness. The rich green pods are almost round, meaty, absolutely stringless even when mature. It is tender and of delicious flavor, and should have a place in every garden. Dry beans oval, dark brown, with white eye.

Dwarf Horticultural. A late variety that is very productive of broad, flat, stringless pods. One of the best sorts for use as a shell Bean. The dry beans are large, oval, nearly covered with splashes of bright red. The pods are green when young but when mature are yellow splashed with red.

Giant Stringless Green Pod. Truly a giant, for its pods average 6 inches and over in length. It is one of the best first earlies and produces an abundance of its round, stringless pods, which are good at all stages of growth. The plants stand dry weather exceptionally well. Dry beans rather long, light brown in color.

Burpee's Stringless.

Full Measure. Matures in about 62 days. Grows 14 to 16 inches high, with foliage slightly larger than Stringless Green Pod, more of a yellowish green. Pods average 6 inches long, more curved than Stringless Green Pod, absolutely stringless, possibly more green in color, but not so large in circumference. Decidedly the best round-podded stringless Bean in existence. Pods contain 5 to 7 mahogany colored beans.

Improved Red Valentine. An extra early variety that usually matures in 35 to 40 days after planting; also fine for midsummer sowing, to ripen in September. The vigorous bushes bear an abundance of medium length green pods which are very fleshy, crisp and tender. Dry beans are of medium size, long, pink, marbled red.

Refugee or 1000-to-1. A little later than most green-podded sorts, but very prolific. It is fine for late fall planting, for use in pickling. The pods are nearly round, pale green, about 5 inches long, very fleshy and brittle, with slight strings but exquisite flavor. Dry beans long, brownish gray, with light specks sometimes of a purple shade.

Long Yellow Six Weeks. The large, vigorous plants are very productive of long, green pods which are straight and flat and of fine quality. The dried beans are long, kidney-shaped and dark yellow.

Tennessee Green Pod. The largest, longest and broadest of the green-podded Bush Beans on the market. It is an excellent variety with thick meaty pods of fine flavor. Dry beans of flat, irregular shape, dark brown color.

PRICE LIST ENCLOSED OR MAY BE HAD ON REQUEST.

Soup or Shell Beans

Improved White Navy Bean. Also called Pea Bean. A good sort for either market or home use. It is smaller than the White Marrowfat, but is of fine flavor, and is the variety used in making the famous "Boston Baked Beans." Very productive and is largely planted everywhere. Dry beans small and pure white.

Red Kidney. A standard old variety that is very popular. It is grown almost exclusively for the dried beans, which are long, oval, and purplish brown in color. The plant is dwarf.

White Kidney. Excellent either as a shell Bean or used green. The beans are white and larger than either the Improved White Navy or White Marrowfat. Splendid for baking or soup. Dry beans pure white, kidney shape.

White Marrowfat. A dwarf variety that is largely planted and used, both as a string and shell Bean. A profitable sort for the market gardener to grow, and a necessary one for the home gardener. The dried beans are large and white, oval shape.

Pole Beans

One pound will plant about 200 hills.

Dutch Caseknife. A good variety for either snap or shell Beans. The long, flat, green pods are borne early in the season. The dried beans are large, flat, and pure white, which makes it an exceptionally good sort to grow for winter use.

Golden Cluster Wax. An extra strong grower and very productive. The flat, stringless pods are large, 7 to 8 inches long by $\frac{3}{4}$ inch wide, and are borne in clusters. They are rich golden yellow, of excellent flavor, and remain fit for use a long time. Vines bear continuously. One of the best yellow-podded Pole Beans. Dry beans oval, pure white.

Kentucky Wonder.

Lazy Wife Pole Beans.

Kentucky Wonder (Old Homestead). This extremely productive variety is entirely stringless. The silvery green pods, which are 8 to 10 inches long, hang in clusters the entire length of the plants. It is one of the earliest of the green-podded Pole Beans, and of exceptionally good quality. If the pods are gathered as they mature, the plants will continue to bear until the end of the season. Dry beans are long, almost kidney shape, grayish brown.

Kentucky Wonder Wax. A yellow-podded form of the preceding, with all its good qualities, but which yields quicker from seeding than most of the other Pole Beans. The yellow pods are meaty, brittle, and of good flavor. This Bean is steadily growing in favor. Dry beans are dark brown and irregular in shape.

Kentucky Wonder, White. An improvement on the old Kentucky Wonder in that the dry beans are white. It has all the good characteristics of its parent which is sufficient recommendation to all who know that splendid sort.

Lazy Wife. The best late green-podded Pole Bean. It is an extremely heavy yielder of broad, thick, fleshy, dark green pods which are entirely stringless and average 6 inches in length. The dry beans, which are borne 6 to 8 in the pod, are excellent for winter use. Dry beans large, oval, pure white.

Horticultural (Speckled Cranberry). Can be used both as a shell and snap Bean. The pods are of medium size, pale green streaked with bright red, tender and of excellent quality. Especially good for short seasons and cool locations. Dry beans large, oval, dark tan covered with red dots.

White Creaseback. A good early green-podded sort. The pods are perfectly round and stringless, measuring 5 to 6 inches long, and grow in clusters. The white dried beans are fine for winter use. One of the best general purpose Beans. Dry beans pure white, almost kidney shape.

Red Speckled Cut Short (Corn Hill). This extensively cultivated, green-podded climbing sort, with red-speckled, oval seed, is used largely in the South for planting among corn. It will give a good crop without the use of poles. The vines are medium sized, but vigorous, twining loosely, with dark colored leaves. The snap pods are short, 3 to $3\frac{1}{2}$ inches, straight, flat to oval, fleshy and of good quality. The pods as they mature become light yellow, tinged with red, the beans showing distinctly through the pod. Seed nearly oblong, cut off diagonally at the ends, light grayish white, covered about the eye and at one end with reddish or purplish brown, and irregularly dusted over most of the surface with the same color.

Large White Lima Beans.

Dwarf or Bush Lima Beans

One pound will plant 50 to 100 feet of drill.

Burpee's Bush Lima. A good standard variety that grows 18 to 20 inches high. The Beans are large and luscious, and the plants are immense yielders. First introduced in 1890 and still one of the most popular varieties. Dry beans large and flat.

Burpee's Improved Bush Lima. An improved form of the preceding. The growth is more vigorous, the plants often reaching 30 inches in height, and the pods average 6 inches long by 1 1/4 inches wide. Not only are the pods and beans larger, but they produce more beans to the pod, and, most important, fully eight days earlier. The pods are frequently borne in clusters of five to eight, and much more profusely than on the preceding variety. The best Lima to date. Not quite so large but much thicker when dry than the Burpee's Bush Lima.

Fordhook Bush Lima. The "Potato Lima" which has been growing in popularity since its introduction in 1907. The bushes are of stiffly erect habit, bearing the very large pods in clusters of from four to eight. It is four to six days earlier than the average Bush Lima, and its green Beans, even when mature, are tender, juicy, and sweet when cooked, a great improvement on the dry, mealy character of other varieties of the Pole Lima type. Dry beans are medium size, very thick, and almost round.

Henderson's Bush Lima (Sieva or Butter Bean). Appearing two to three weeks ahead of other Pole Limas, it produces an abundance of small, tender Beans of delicious, rich, buttery Lima flavor until frost. It also retains this exquisite flavor when dried, making it very desirable for the home garden. Dry beans are very small for Lima Beans and rather thin. Used by canners to some extent.

Carolina Sieva or Small Lima. This is the true Butter Lima. The Beans are very small and white, on the order of Henderson's Bush Lima, and the plants are of large growth, very early, vigorous, and productive, standing more heat and drought than any other of the Limas. Truly a southern favorite.

Brussels Sprouts.

Brussels Sprouts

One ounce will produce about 3,000 plants

A delicate flavored variety of Cabbage having small, solid, tender heads, clustered thickly along the main stem. They form a very delicious dish when properly cooked, literally melting in the mouth, like cauliflower. Sow seed in April or May, and cultivate like cabbage. Seed apparently same as that of cabbage.

Pole Lima Beans

One pound will plant about 50 hills.

King of the Garden. A vigorous grower, producing an abundance of large, dark green pods which frequently contain five or six very large beans. These Beans are of excellent quality. One of the best of the Pole Limas. Dry beans large and flat.

Large White Lima. The old-fashioned Pole Lima. Long, thick pods and large, meaty beans of good quality. Dry beans resemble King of the Garden very closely.

Early Jersey (Siebert's). Matures ten to fifteen days earlier than other Pole Limas, making it a good variety to plant where the season is too short to produce later sorts. It is a very heavy yielder of fine quality Beans. Dry beans slightly smaller than the Large White Lima.

Henderson's Bush Lima.

Detroit
Dark Red
Beet.

Beets

One ounce will sow about 100 feet of drill;
5 to 6 pounds to the acre.

Beets should be planted in any good soil, the richer the better. Beet seed is light in weight, of irregular, rough shape, and color varies with age, from light yellow to dark brown; one-half to three-sixteenths inch in diameter. Before sowing, if seeds are soaked over night, quicker results will be obtained. Sow thinly, about one-half inch deep, in rows a foot apart. If seedlings are close, thin to one inch apart, and when six inches tall, remove every other plant. The thinnings may be eaten; the very young Beets, cooked with the greens, are delicious. The Beets should stand at least 3 to 4 inches apart.

Detroit Dark Red. An ideal Beet for the home and market garden. The roots are globe-shaped, dark red, and uniformly smooth. When young the flesh is almost black-red, turning to dark crimson with dark purple zones as the Beets mature. They are an appetizing dark red when cooked and very sweet. Every garden should contain some of these delicious Beets.

Early Blood Turnip. A fine early sort which is also good for summer and autumn use. The dark red roots are very sweet and tender, with a fine flavor.

Extra Early Egyptian Blood Turnip. This is the best variety for forcing and it is also excellent for first-early crop outdoors, being very early, with small tops. The leaves are dark green, shaded and veined with dark red and the roots are very dark red, moderately thick, a little rounded on top, distinctly flat on the bottom, and about 2 inches in diameter when mature; flesh dark purplish red, zoned lighter, firm, crisp and tender.

Crosby's Extra Early Egyptian. An extra quick grower, suitable for forcing or growing outdoors. The flat, smooth, turnip-shaped roots average 2 inches in diameter, and are dark red, zoned lighter, but tender and of good flavor. Fine for table use and canning and largely planted for home and market. The tops are small.

Eclipse. One of the first to be ready for the table, producing Beets 60 days from the time of sowing. The flat, globe-shaped roots of uniform dark rosy red are easily pulled; flesh dark rosy red, with rose zones, tender and sweet. Does not grow large, but is very desirable because of its earliness and sweet, tender quality.

Long Dark Blood. Keeps well through the winter. The roots, which measure 1 to 1¼ feet, grow one-third out of the ground. The leaves are green veined with red and the flesh deep red. A good variety for fall and winter use.

Sugar Beets

Five to eight pounds will sow about one acre.

Sow in rows about 2 feet apart and thin out to 9 to 12 inches in row. Plant in deep, rich soil.

Giant Half-Long White. A larger yielder under favorable conditions than any other Sugar Beet. The roots grow partly out of the ground, and this, together with its shape, makes it less expensive to harvest than almost any other root crop. The roots are long and ovoid, with green tops.

Mangel-Wurzel

Six to eight pounds will sow about one acre.

Seeds same as those of Beets.

Golden Tankard. A heavy cropper on good land and easily harvested. The large, sweet, yellow roots are much relished by stock. One of the best of the Mangel-Wurzels.

Mammoth Long Red. This is a particularly good variety, having roots 2 feet or more in length and 6 inches in diameter. The skin is bright red, and the flesh white, with veined rings of rose-pink. Enormously productive.

Swiss Chard (Spinach Beet).

Swiss Chard (Spinach Beet)

One ounce will sow about 100 feet of drill.

Swiss Chard is grown for its tender, succulent tops, which are used as greens. Seeds same as those of beets. Seed planted early in spring will in a short time produce plants from which cuttings may be made all summer. Sow seed thinly in rows 18 inches apart, and thin until plants stand a foot or more apart. When the leaves mature, they should be cut from the stalks, which may be served separately, like asparagus.

Cabbage

One ounce will produce about 3,000 plants.

All Cabbage seed is small, round, and brown in color, greatly resembling turnip seed. Sow in January or February, under glass or in flats in the house, and when leaves are a few inches long, harden off and transplant to the garden. Set plants deeper than before, allowing 18 inches apart for dwarfed sorts and 2 feet for larger ones. The soil should be rich and moist, but not wet. Cultivate well and regularly.

Early Varieties

Copenhagen Market. An extra early Cabbage that always makes large, solid heads early in the season. The heads, which weigh 10 to 12 pounds, are borne on short stems. Unexcelled as an early Cabbage and can be planted close together.

Early Jersey Wakefield. One of the most popular Cabbages in cultivation. The pyramidal heads are extremely solid, of excellent quality, and have little outside foliage, allowing of close planting, which makes it a most profitable sort to grow. A sure header, largely planted by the home and market gardener.

Charleston Wakefield. Similar to the Jersey Wakefield but just about half again as large and matures about two weeks later. A good sort to plant for a succession to follow Early Jersey Wakefield. Used largely in the South.

Early Winnigstadt. Not quite so early as Early Jersey Wakefield, but with heads of the same size, only not so pointed. The rich, dark green, slightly glossy leaves are very tightly folded, making one of the hardest headed of the early Cabbages, and for that reason a great favorite for winter use and for graut. A sure header, of very good quality; a good keeper. No garden should be without this splendid sort.

Golden Acre. (New). A very early selection of the Copenhagen type and the earliest of the round-headed Cabbages. The medium-sized heads are very solid and uniform.

Second Early Varieties

Early Flat Dutch. A good early market sort. The heads are very large, weighing about 10 pounds, nearly round, solid, crisp and tender.

Golden Acre Cabbage.

Early Jersey Wakefield.

Allhead. This variety is considerably larger than others of equal earliness. The heads are deep and flat, remarkably solid, and very uniform in color, form, and size. Although usually grown for summer and fall use, it is equally good for winter, being an excellent keeper.

All Seasons. Very desirable for either early spring, summer or fall use. The heads are very large, flat, and of fine quality. Grows well under varying conditions.

Enkhuizen Glory. The round, ball-like heads are produced as early as Allhead. They are of medium size, weighing from 6 to 8 pounds when trimmed, very solid, with few outer leaves, permitting close planting, and are very tender and fine flavored. A good winter keeper.

Late Varieties

Danish Ballhead. The popular winter Cabbage. The heads are nearly round, very solid, well flavored and firm grained, making it the best variety for winter use. Its numerous good qualities have caused it to be more largely planted in America than any other Cabbage.

Large Late Drumhead. Another excellent winter keeper, with very large, roundish, solid heads, having few loose leaves. Can be closely planted thus insuring a larger crop from a given area, and making it a more profitable sort for the home or market garden. A good general purpose Cabbage.

Late Flat Dutch. One of the best known winter Cabbages and one of the most reliable. It produces immense heads of excellent quality which keep well all winter. This variety has been on the market some time but each year increases its popularity.

Red Varieties

Mammoth Rock Red. The largest of the Red Cabbages, with remarkably solid, round heads which mature late in the season. It is a sure header and is considered the best of the red varieties.

Savoy Cabbage

American Drumhead Savoy. One of the best Savoy Cabbages in flavor and unequaled in general use. The fine curled dark green leaves form large, firm heads that keep very well over winter.

Early Snowball Cauliflower.

Cauliflower

One ounce will produce about 3,000 plants.

Cauliflower seed closely resembles cabbage or turnip seed. For early Cauliflower, sow in greenhouse in January or February and transplant to flats in the house or cold frames, 2 to 3 inches apart each way. When the soil can be worked, set the plants 2 to 2½ feet apart each way in rich fibrous loam. Blanch heads by drawing leaves together over them and tying with raffia or strips of soft cloth. For late Cauliflower, start plants in open ground, like late cabbage.

Early Snowball. A very early variety that produces excellent white heads of medium size. The plants are compact growers, with short outside leaves. Fine for hotbed culture, as well as for growing outdoors. Cauliflower is one of the most delicious of our vegetables and should have a place in every garden.

Carrots

One ounce will sow about 100 feet of drill.

Soil in which Carrots are to be grown should be thoroughly manured the season previous to planting, as forked roots will result if seed is sown in freshly manured soil. They prefer deep, loose, fertile soil, but will thrive in good, well worked garden soil. Carrot seed resembles celery seed in shape but is some larger and slightly striped. In April, as soon as ground is warm and fit to work, sow the seed for the first crop, and make successive sowings until August 1st, the last being for fall and winter use. Plant seed one-half inch deep, in rows 12 to 15 inches apart, and thin plants to 3 to 4 inches apart in rows.

Chantenay. An excellent variety for winter use, as it is easily harvested and immensely productive. The roots average 5 inches in length, being 3 inches in diameter at the shoulders and tapering to the broad stump root. The flesh is tender, fine grained, free from hard core, and deep golden orange in color. A very choice early variety.

Danvers Half-Long. This variety, although stump-rooted, produces more bulk to the acre than the larger rooted sorts. It is a rich orange-red in color, smooth and handsome with sweet, crisp, tender flesh. A favorite for years with both home and market gardeners.

Early French Forcing. The earliest Carrot in cultivation, and fine for forcing. The tops are small and the roots reddish orange, nearly round when forced, but larger when grown outdoors, reaching a length of 2½ inches when mature. The flesh is tender and sweet.

Large White Belgian. Grows one-third or more out of the ground. The roots attain a length of a foot or more and average about 2 inches in diameter throughout their entire length. They are easily pulled and do not have to be dug out as do most long-rooted sorts. The coarse flesh, and also the skin, is pure white, with an occasional tinge of green where growing above the soil. One of the best varieties for stock feeding.

Large Yellow Belgian. Like the preceding in every respect but flesh and skin pale orange.

Long Orange Improved. Suitable for table use as well as stock feeding. It is a heavy yielder of long, rather thick roots which taper to a point. They measure 12 inches in length and 3 inches in diameter at the crown, and are deep orange in color. It is an intermediate to late variety, and when table size is tender and of good quality.

Oxheart (Guerande). Good when young for table use and when mature for stock feeding. The roots are very thick and reach a length of 4½ to 5 inches, ending abruptly in a tap root. The flesh is bright orange, fine grained, and very sweet. They grow well in soil too hard for the longer rooted sorts, and are easily dug on account of their shape. A fine all-purpose variety.

Chinese or Celery Cabbage

Chihli. Earlier than Pe-Tsai. Plants grow to a long, solid, white, cylindrical head 2 feet long. Leaves broad, smooth, fringed on the edges. A sure heading variety of superior quality.

Pe-Tsai. A delicious vegetable resembling Cos lettuce, only a little heavier. It is not a cabbage, despite its name, and was introduced into the United States from China by the United States Department of Agriculture. Sow seed about August 1st in frames, and transplant or sow in rows where plants are to remain, 2½ feet apart, thinning to 12 inches apart in the row. Heads light green; leaves crumpled, tender, and of delicious flavor, and it retains its crispness and flavor a long time. Inner leaves blanch creamy white, and may be eaten raw or cooked like asparagus.

Oxheart Carrots.

Golden Self-Blanching.

Celery

One ounce will produce about 3,000 plants.

Seed small, yellow, slightly striped gray; Celery odor. Sow seed in cold frames or in a warm seedbed outdoors, in rows 8 to 10 inches apart, covering seed one-fourth inch. Transplant when fairly out of the seed leaf to another bed, or thin to 5 to 6 inches apart. The plants should be set in shallow trenches in July, wide enough to hold one or two rows. The rows should be a foot apart and the plants be set 8 inches apart in the row. Earth up gradually to blanch, being careful not to get earth in the heart of the plants.

Giant Pascal. One of the finest of the fall and winter sorts. The stalks are very large, thick, solid, and crisp, with a delicious nutty flavor free from bitterness. It blanches easily and quickly.

Golden Self-Blanching. A very good early self-blanching Celery. It is a vigorous, compact grower, with straight, rich golden yellow stalks of excellent quality, being remarkably crisp, tender, and free from stringiness.

White Plume. A good fall and winter sort, and a very popular market variety. As the plants mature, the inner stalks and leaves turn white, making it necessary to earth it up but little to complete the blanching. The flavor is good. A rapid grower which makes a handsome appearance when cut.

Dwarf Golden Heart. This is a fine main crop sort for fall and winter use. It is a compact, dwarf grower which is easily earthed up for blanching. The large, bunchy stalks have very solid hearts that blanch to a lovely waxen yellow, and are crisp and brittle and of excellent flavor. A good keeper.

Columbia. Although a second early variety, it is a fine keeper, remaining in good condition all winter. The plants are dwarf and compact in growth, blanching easily. The stalks are very thick, broad and smooth, and are almost snow-white when blanched, with the heart tinged yellow. It cannot be excelled in quality and flavor—sweet, nutty, and very crisp.

Winter Queen. One of the best of the dwarf winter varieties. It resembles Golden Self-Blanching, but has the rich green coloring of Giant Pascal, yet blanches more quickly than the latter variety and is ready for market much earlier in the fall. It makes a handsome appearance when bunched for the large, extra heavy stalks are all one length, with very large hearts.

Celeriac or Turnip-Rooted Celery

This is a variety of Celery with turnip-shaped roots which have the flavor of Celery and are white-fleshed and tender. Sow seed in the open ground in April and transplant the young plants like Celery. The roots may be eaten raw, like radishes, or cooked like turnips; used largely for seasoning soups and stews.

Corn Salad

One ounce will sow about 150 feet of drill.

Broad-Leaved Large-Seeded. This is a hardy winter salad plant, the small leaves being served like lettuce. Seed irregular in shape, grayish yellow, made up of three sections. Sow in light, warm soil in August or September, in drills one-fourth inch deep and six inches apart. Just before winter, cover thickly with straw or leaves. Pick the leaves when half as large as lettuce.

Celeriac or Turnip-Rooted Celery.

Corn, Sweet or Sugar

One quart will plant about 200 hills.

Plant Corn every three weeks from April to July, for succession, placing six seeds in a hill, the hills 3 feet apart each way, and covering one-half inch. When well up, thin to three plants to a hill.

Barden's Wonder Bantam. An 8-rowed, early, yellow Corn with ears 8 to 10 inches long, set up higher on a more sturdy stock than the Golden Bantam parent, but of equal sweetness, flavor and color and it matures at the same time with a greater yield.

Black Mexican. Medium early. The ears measure about 8 inches in length and are well filled with large, rather flat, bluish purple grains of deliciously sweet flavor. When fit for table use, the grains are white. Seed black, short, round, same size as Early Minnesota.

Crosby's Early. Extra early. The medium sized ears are filled with very sweet, thick grains. A productive, vigorous, and hardy sort. Seed short, round.

Country Gentleman (Shoe Peg). Late. The ears are of good size (7 to 9 inches long), and the cob is small, densely covered to the very tip with irregular rows of very long, tender, white kernels of delicious flavor when cooked. Stalks average 7 feet in height and frequently yield three ears each. Claimed by many to be the best flavored Sweet Corn and has long been a favorite of connoisseurs. Seed long, slender.

Early Adams. Not a Sweet Corn, but grown for table use because of its earliness. The ears are medium in size, and at the proper stage for cooking the grains are tender, milky, and quite sweet. A robust grower and heavy yielder. Seed white, short, round, resembling Field Corn.

Early Minnesota. A standard early sort of strong growth. The medium large ears are well filled with good sized, well flavored kernels. Seed white, short, medium size.

Golden Bantam. Early. The ears are small (about 5 inches) and the grains cream-yellow in color, but the delicious flavor and the tender quality when cooked is not surpassed by any other variety of Sweet Corn, and is fast making it one of the most popular for the home and market garden. The plants are dwarf, attaining a height of 3 to 4 feet and bearing two or more ears to the stalk. Seed golden yellow, short, round, germinating quickly and the plant comes into bearing early.

Golden Sunshine. A Bantam type. A few days earlier than Golden Bantam. Stalks more dwarf; ears 12-rowed, about 6½ inches long.

Early Evergreen. Resembles Stowell's Evergreen in flavor, appearance and quality, but ripens 10 days earlier and remains in good condition as long as that variety. The ears usually measure 7 inches long. Seed same as Stowell's Evergreen.

Golden Sunshine Sweet Corn.

Howling Mob. Medium early. One of the best flavored and most tender of the medium early varieties. The ears measure 7 to 9 inches in length, with 12 to 14 rows of large, pearly white grains. The stalks usually produce at least two ears. This variety well merits its great popularity, both for the home and market garden. Seed yellowish, short, round.

Kendel's Early Giant. Second early. The largest eared Sweet Corn in its class, averaging 8 to 10 inches in length and having 10 to 12 rows of large grains of rich sugary flavor. The kernels are pure white and of fine quality. A favorite with both home and market gardeners. Seed yellowish, short, round.

Late Mammoth. Very large ears which are thick through, with large, broad grains of rich sweet flavor. A very vigorous grower. Seed white, round.

Mammoth White Cory. Early. A great improvement on the old White Cory. A very productive sort with large ears and white cobs. The grains are large and sweet. It is being more largely planted each year. Seed yellowish, round.

Bantam (Golden Evergreen). One of the recent additions to the Sugar Corn family, one-third larger than Golden Bantam, 10 to 14 days later and will mature after that variety has passed the usable stage. Stalk 7½ to 8 feet high. Ears thick, 7 to 8 inches long.

Stowell's Evergreen. Midseason. More largely planted than any other Sweet Corn, for home use, market, and canning. The long, slender grains are of good size and are free from glaze and flintiness. The ears are large and very freely produced. It is an exceptionally good canner and remains in good condition for cooking a long time. Seed white, long, large.

Stowell's Evergreen Sweet Corn.

Improved White Spine Cucumber.

Cucumbers

One ounce will plant about 50 hills.

All Cucumber seed is about one-fourth inch long, oblong in shape, resembling very much the seed of muskmelons. For an early crop, plant the beginning of May in a hotbed or in paper pots. The plants will be ready for transplanting in the open ground in from three to four weeks. Set in hills 4 feet apart each way, thinning out to about four plants to a hill when established. Plant seed in hills in May for succession. For pickles, plant last two weeks of June. An infusion of Hellebore powder in water will destroy the striped bug.

Early Fortune. Slightly longer than Arlington White Spine, more cylindrical in shape, with very dark green skin and thick flesh, which is tender and crisp. A remarkable feature of this variety is the strong growth of the vines, which enables it to successfully withstand blight and bring the fruits to their full size and perfection. Early Fortune Cucumber is one of the best that has been introduced in years, and will soon take the place of many old-time strains of White Spine Cucumber.

Boston Pickling. The standard pickling variety. The vines yield heavily, and if fruits are picked as soon as large enough, they will continue to bear through a long season. The fruits reach a length of 4 to 5 inches and are excellent for slicing, but it is more popular as a pickling variety.

Davis Perfect. A very vigorous grower, producing an abundance of fine textured, excellent flavored fruits from 7 to 9 inches long and 7 inches in circumference in the middle. The skin is dark, rich green, and the flesh is fine for slicing. The fruits are very handsome and regular in shape.

Early Green Cluster. A slender fruited variety that makes excellent pickles. The vines are very prolific, frequently bearing the fruits in clusters of two and three. Will continue long in bearing if fruits are kept picked.

Improved Long Green. One of the best pickling sorts. The vines are very productive of uniform, dark green fruits which are tender, crisp, and of fine flavor. A great favorite with the market gardener because it is such a heavy yielder.

Improved White Spine. A very good table variety, because of its light green color, which it retains a long time after being picked. The fruits are nearly cylindrical in form, slightly pointed at ends, light green, with white spines; very smooth.

Endive

One ounce will sow about 200 feet of drill.

Seed resembles pieces of straw cut one-sixteenth inch long. Sow seed in good garden soil in June, July or August, and cover lightly. When plants are well up, thin to 8 to 10 inches apart, and when the leaves are 6 to 8 inches long, blanch by tying together near the top. For winter use, take up plants with a ball of earth and place close together in a frame or cellar, being careful to keep them dry and give them plenty of air.

Broad-Leaved Batavian. A heavy cropper that is very hardy. Excellent salads can be made from the broad, thick leaves when blanched. This variety is much larger in size, thicker, and more fleshy than the other sorts.

Green Curled. This is the variety most generally cultivated. The beautifully curled, dark green leaves are very crisp and tender when blanched. They are fit for use earlier than the other sorts.

Moss Curled. The leaves of this variety are very finely divided and curled, forming very attractive, compact plants. It is very tender, of excellent quality, and will in time supplant the other standard varieties.

White Curled. Resembles the Moss Curled, but the leaves are of light green color, blanching very easily, making it a very attractive sort for salads and garnishing.

Green Curled Endive.

Eggplant

One ounce will produce about 1,000 plants.

Seed should be sown in hotbed in February and March, and the plants thinned out to 2 to 3 inches apart when they have reached a height of 1 to 2 inches. Set out in rich soil when the weather is warm and settled, 2 feet apart each way. Seed resembles that of the pepper, but smaller.

New York Improved Purple. One of the most popular of the Eggplants because of its great productivity. It is not unusual for a single plant to bear 6 to 8 fruits of excellent quality. The fruits are large, nearly round, dark purple, and free from thorns. The home or market gardener cannot do better than plant this variety.

New York Improved Purple Eggplant.

Kale or Borecole

One ounce will produce about 300 plants.

A popular boiling green resembling cabbage in flavor. The plants are hardy in well drained soil. Seed resembles that of turnips and cabbage. Sow seed in May in shallow drills 10 to 12 inches apart, and, when large enough, transplant singly in rows 2 to 3 feet apart, and 2 feet apart in the rows. The flavor of the leaves is considered to be greatly improved by the frost.

Tall Green Curled Scotch. The stalks average about 3 feet in height, with long, plumelike leaves that are deeply fringed and finely curled at the edges. Quality is especially good.

Dwarf Green Curled Scotch. A low-growing, compact variety, with tender, deep green, finely curled and crimped leaves. The plants seldom grow higher than one foot, but reach a diameter of two feet if well cultivated. Two weeks later than the Tall Green Curled Scotch, but remains in good condition longer before going to seed.

Dwarf Siberian or Sprouts. A very hardy sort, with large, broad leaves. Seed resembles that of turnips. Sown in September and treated like spinach, can be cut in the spring.

Kohl-rabi.

Kohl-rabi

One ounce will sow about 200 feet of drill.

A delicious vegetable that combines the good qualities of the turnip and the cabbage, but is superior to both in nutritive and productive qualities. Seed resembles that of turnips and cabbage. Sow in spring in rows 18 inches apart and thin the plants to stand 8 inches apart in the row. Plant in late July for fall use.

Early White Vienna. An early sort that grows rapidly. The foliage is small and the bulbs round and white, with fine grained white flesh that is remarkably tender. This tasty vegetable will have a place in every garden when better known, for few others equal it in delicacy of flavor.

Leek

One ounce will sow about 100 feet of drill.

The Leek is superior to the onion in flavor and is much used in seasoning soups and boiling with meats. Seed resembles that of onion in shape and color but is slightly smaller. Sow seed very early in a sheltered place, and when 6 inches high transplant to trenches 6 inches deep, putting very rich soil at the bottom. Fill in the trenches as the plants grow, and later draw the soil up to them. This will produce fine, large Leeks, blanched for 6 inches or more, and which may be kept all winter if dug with the roots and stored in moist sand in the cellar.

London Flag (Large American). The most largely cultivated variety. It is a strong grower, very hardy and productive, with large, thick stems.

Leek.

Few People Realize

how delicious fresh vegetables are until they have tasted those from their own garden.

Lettuce

One ounce will produce about 1,000 plants.

For an early crop of Head Lettuce, sow the seed in February or March in the hothouse, or in boxes or flats in the house, and transplant as soon as the ground can be worked. Set in rows 18 inches apart and 8 to 10 inches apart in the row. Sow seed outdoors every two weeks for a succession, covering lightly by raking, so that the birds do not get it. It is best to sow Lettuce in rows, as it can then be cultivated.

Big Boston. Easily the most popular of the Head Lettuces, as it is good for early, midseason, and fall use. The large, compact heads are bright light green, blanching to rich yellow at the heart, and are deliciously sweet, tender, and crisp. It is an exceptionally good market variety, as the heads are very solid and have few outside leaves. White seed.

Black-Seeded Simpson. The broad, light green leaves, much blistered, crumpled and twisted, form a large, firm bunch which blanches well and is decidedly crisp. One of the best bunching varieties and marketable early in the season. Black seed.

Early Curled Simpson. Another strictly bunching variety that stands high in public favor. The leaves are very light green, much blistered and crumpled, and deliciously sweet and crisp. White seed.

Grand Rapids Forcing. Fine variety for forcing under glass, but also good for outdoor planting. The crisp, light green leaves form a loose, rounded cluster that matures early. A good market sort as it ships well, retaining its crisp quality much longer than other varieties. Black seed.

Hanson. A cabbage-heading variety that reaches a large size and matures very late. The light green heads are globular, very solid, blanch well, and are decidedly crisp. Greenish gray seed.

May King. Good for planting outdoors for an early crop, but is also a fine forcer. Cabbage-heading, forming heads small to medium in size and of rich buttery flavor. The light green leaves are slightly tinted with brown at the edges. White seed.

New York. A large cabbage-headed variety that matures late. The dark green heads are globular, very solid, blanch well, and are decidedly crisp, very sweet but never buttery in flavor. White seed.

Grand Rapids Forcing Lettuce.

Prize Head. Desirable variety for the home garden as it is decidedly crisp and of good flavor, forming large heads of blistered, crumpled leaves that are light brown on the outside of the plant, varying to bright green toward the center, which is always well blanching. Light greenish gray seed.

California Cream Butter. One of the best sorts for open ground planting. During cool weather it produces very large, solid, round heads, the interior of which blanches to a beautiful white. Largely planted in the South for shipping to the northern markets during the winter. Dark brown seed.

Iceberg. A very popular variety because it remains tender and crisp even when grown in the hottest weather. The heads are unusually solid, with thick-ribbed, incurving leaves that insure a well blanching heart. White seed.

Mustard

One ounce will sow about 75 feet of drill.

Seed resembles that of cabbage and turnip. For an early crop, sow in the hotbed in March. Sow outdoors in drills 8 to 12 inches apart at intervals throughout the spring and summer, and cut when not over 2 inches high. Fine used as a salad or cooked like spinach.

Giant Southern Curled. A vigorous growing, hardy variety, forming a large mass of curled and ruffled leaves.

White London. The best variety for salads. The leaves are dark green, small, and smooth. A very rapid grower.

Big Boston Head Lettuce.

Garden
?

Giant Southern Curled.

Muskmelons

One ounce will sow about 80 hills.

Demands a light, sandy soil, and planting should not be done until the ground has become dry and warm. Seed resembles that of cucumber in shape, size and color. Sow 6 to 12 seeds to a hill, the hills to be 6 feet apart each way, and cover one-half inch deep. When the plants have produced their rough leaves, thin to three plants to a hill. Pinch out the ends of the growing shoots to induce early fruiting.

Pollock's No. 10-25 Rust Resistant. The melons run very uniform in size, and the exceptionally heavy netting is laced and interlaced over the entire surface, making it an ideal shipper. The flesh is green, shading to salmon about the seed cavity, which is unusually small. The meat is solid and fine grained; flavor unexcelled.

Paul Rose. This Melon is a cross between the Osage and Netted Gem, and about 10 days earlier than the former. Of a size very suitable for shipping in baskets, it is becoming very popular in the market, especially where its superior qualities are known. The thick, red flesh is exceptionally sweet.

Banana. So called because of its shape. Melons large and thin-skinned, with salmon flesh of delicious quality. Fine for the home garden.

Emerald Gem. Considered by many to be one of the best salmon-fleshed Melons. It is a small variety, with dark green skin and flesh that is sweet and delicious. The vines yield heavily, and the fruits always sell well in the markets.

Extra Early Hackensack. A good variety where an early crop is desired, and has so many good qualities that it has become immensely popular. The Melons are large, flat and well netted, and the flesh is thick, green, and of excellent flavor. Always a good seller on the market.

Osage. A large, round, salmon-fleshed melon with light green, netted skin. The flesh is very thick and sweet. One of the best shipping Melons.

Rocky Ford. The Melons are oval in shape and heavily netted, measuring about 5 inches in length. The smooth, light green flesh is delicious in flavor. A very good sort that has been on the market a long time but is still very popular with lovers of good Melons.

Tip-Top. One of the most productive Melons, and good for either early or late crop. The fruit is large, nearly round, and moderately netted, and the flesh solid, sweet, juicy, of fine flavor, and can be eaten to the very rind. One of the best all-round Melons grown.

Pollock No. 10-25.

Honey Dew Melon. The delicious honey-like flavor of this new Melon created a sensation wherever used last year. The fruit is of good size, weighing 6 to 8 pounds, with light cream colored, smooth skin and thick, rich, sweet flesh of light green color. Rind thin but tough, and so close that the rich flesh is practically sealed up where it keeps in finest condition for several months after it is ripe.

Hearts of Gold. An ideal basket and crate Melon of medium size, with round, heavily netted skin and very thick rich sweet orange flesh. The average size of the Melon is 6 to 8 inches in diameter—a very convenient size for the table and for packing in shipment. Matures in 75 days. The seed cavity is small and the rind is very tough, making it a good shipper. A vigorous grower and a heavy cropper.

Okra or Gumbo

One ounce will sow about 100 feet of drill.

Seed resembles that of sweet peas in shape, color and size, but has white tip on one side. Sow after the ground has become warm, 1 inch deep, in drills 4 feet apart, and thin to 12 inches apart. Should usually be picked two days after the blossoms have fallen, before the pods have become hard and stringy.

White Velvet. A very good variety with smooth, velvety, long, white pods that are very tender and of superior flavor.

Hearts of Gold Muskmelons.

PRICE LIST ENCLOSED OR MAY BE HAD ON REQUEST.

Watermelons

One ounce will sow about 50 hills.

Watermelons should have the same culture as muskmelons, but should be planted 8 to 10 feet apart, depending on the variety.

Cole's Early. An extra early variety with thin rind and beautiful red flesh of fine texture, lusciously sweet; oval, medium size. One of the best sorts for the home market. Seed dark grayish brown.

Dark Icing. A very solid, round Melon with pink flesh that is sweet and melting. Highly prized as a shipper. White seed.

Florida Favorite. Melons of medium size, with light green skin, striped darker; flesh deep red, crisp and sweet. White seed.

Georgia Rattlesnake. (Striped Gipsy). An oblong melon of good size and fine quality. The Skin is mottled and striped, and the flesh dark red, of sweet flavor. Grayish white seed.

Golden Gate. (New). Long, symmetrical, dark green, and slightly ribbed; flesh a brilliant red; seeds nearly black. Best eating qualities of any melon. Highly recommended for the home garden.

Harris' Earliest. This melon is large for an early variety, and is very uniform in size and shape. It is slightly oval, with skin mottled light and dark green. The solid bright red flesh is very tender and sweet. Grayish black seed.

Tom Watson. One of the best shipping melons. The fruits measure 18 to 24 inches long and 10 to 14 inches in diameter, weighing 50 to 60 pounds each. The delicious, deep red flesh extends close to the rind, which is dark green and very strong. Seed small, yellow rim, brown center.

Halbert's Honey. Dark green, slightly ridged and blunt at both ends. The flesh is very sweet, melting, leaving no trace of pulp, bright crimson. Not a good shipper as rind is very tender. Very long; seeds white, small, with black tips. Time for ripening, 85 days. Average size, 25 pounds.

Citron, Red-Seeded. An excellent preserving variety with round, handsome melons. Flesh white and solid; seeds red, round, resembling that of watermelon in shape.

Kleckley's Sweet Watermelon.

Kleckley's Sweet (Monte Cristo). One of the best melons for home use or nearby markets. The rind is unusually thin, and the bright scarlet flesh ripens close up to it. It is oblong, with glossy dark green skin. The flesh is crisp and sugary, without stringiness. The melons average 18 to 20 inches in length by 10 to 12 inches in diameter. Seed small, almost pure white.

Irish Grey. A splendid new melon about the shape of Tom Watson. Flesh thick, bright red, very sweet; rind thin, but tough, light grey.

Long Light Icing (Gray Monarch). A long melon with skin mottled very light green, and sometimes reaching a weight of 50 to 60 pounds. The flesh is deep red and very fine-grained. White seed.

Round Light Icing. A round form of the preceding, with all of its good qualities. White seed.

Peerless (Ice Cream). Very early, medium sized oval variety, with solid, deep pink flesh of good flavor. Small grayish white seed.

Phinney's Early. Early, vigorous and productive. Medium size, oblong, smooth, mottled with two shades of green; flesh solid, red sweet and tender. White seed.

Stone Mountain (Dixie Bell). Large, nearly round, of fine quality for home garden. Dark green rind, fairly tough. Flesh a rich scarlet, sweet, with few seeds.

Sweetheart. A good shipping melon and very popular. Large, heavy, of oval to round form, with pale green skin mottled with a darker shade. Flesh solid, deep red. Seed large, dark gray, almost black.

Irish Grey.

Onions

One ounce will sow about 100 feet of drill;
5 to 6 pounds to the acre.

Very fine Onions are produced by sowing seed in the hotbed early in February and transplanting to the open, about 6 inches apart. All Onion seed is black, three-cornered, and about one-sixteenth inch diameter. Sow seed outdoors in rich, sandy loam, in hills one foot apart, as early as possible, and cover with fine soil. When plants are strong enough, thin out to 3 to 4 inches apart.

Extra Early Flat Red. Earlier than the Red Wethersfield, and somewhat smaller. The Onions are flat, very uniform in size and shape, with purplish red skin and close grained, white flesh of rather strong flavor. A good keeper.

Michigan Yellow Globe. An enormous yielder and a good keeper. The bulbs are large, with small necks and rich orange skin.

Prizetaker.

Southport Yellow Globe. Pale straw colored skin and mild flavor have made this a very popular variety for home and market.

White Portugal (Silverskin). The bulbs are large, with silvery white skin and sweet, tender white flesh which is mild flavored; do not keep well.

Yellow Globe Danvers. Most popular of yellow Onions for market and home use, as it is one of the heaviest croppers and best keepers. The bulbs are very large, globe-shaped, with small neck and brownish yellow skin. The flesh is white, fine grained and mild. It is an enormous yielder, a crop of 600 to 800 bushels to the acre being not unusual.

Canada Field Peas

Field Peas can be grown under almost any condition of soil or climate, and not only will they provide a profitable crop, but will enrich the soil at the same time. They are valuable as a food for cattle and also make ensilage of good quality. When sown alone, about 3 bushels of seed are required to the acre. Usually sown broadcast and harrowed in. Seed smooth, small, white or brown.

Red Wethersfield.

Prizetaker. An enormous yellow Onion that is three times the size of Yellow Globe Danvers, and sometimes weighs 4 to 5½ pounds. The skin is thin and bright straw-yellow, giving the bulbs a very handsome appearance. The pure white flesh is crisp, very sweet, and mild in flavor. On account of its large size, it matures about a month later than the Yellow Globe Danvers. This is the variety usually sold in crates as "Spanish Onions." There is no more profitable sort for the home or market gardener.

Red Wethersfield. A very productive and long keeping variety. The bulbs have deep purplish red skin and are large and flat, with a strong flavor. They grow to good size the first year from seed.

Southport Red Globe. The bulbs are of good size (2½ to 3 inches in diameter), globe-shaped, with very small neck and bright red skin. The flesh is fine grained, mild, and tender. Excellent keeper.

Southport White Globe. The white bulbs of this variety are very attractive and always bring a high price in the markets. It is an enormous yielder and good keeper. The flesh is pure white, fine grained and crisp, with a very mild flavor. When mature, store bulbs in a cool, dark shed or loft.

Southport White Globe.

Laxtonian Peas.

Peas

Dwarf Peas require very rich soil, while the taller ones thrive best in rather thin ground. Wrinkled varieties are not so hardy as the smooth sorts and should be planted more thickly and not so early. For an early crop, sow as soon as possible, and repeat every two or three weeks for a succession up to August 1st. Plant either in single or double rows, 2 inches deep and 4 feet apart. It is well to soak the Peas over night before planting, if the weather is dry.

Early Varieties

Alaska. An extremely early, smooth, blue-seeded variety that is very productive. The vine grows 20 to 30 inches high, bearing well filled, medium sized pods. Matures in 55 to 60 days, and can be planted 10 to 14 days before it is safe to put the tender wrinkled sorts in the ground.

First and Best. A very early sort that is extremely popular for market and shipping. The pods are well filled with smooth and slightly wrinkled Peas, and usually mature at one time, so that the entire crop can be gathered in one picking. The vine averages 18 to 24 inches in height. A good canning sort.

American Wonder. (Wrinkled). Bears about the same time as Little Marvel, but not so large or such a heavy yielder. The Peas are very sweet, and its earliness makes it a particularly valuable sort for the home garden. Grows one foot high.

Blue Bantam. A large-podded dwarf Pea of the Laxtonian type. Vine 2 feet high, medium dark green. Pods 4 inches long, broad and straight, containing 6 to 8 deep green peas of fine quality.

Gradus (Prosperity). (Wrinkled). One of the best sorts. Vines are vigorous, 3 feet high and produce uniformly large pods 4 to 4½ inches long, nearly round, and well filled with large Peas of delicious flavor. Matures in 60 days.

Hundredfold. The best of the Laxtonian type. Vines 2 feet high, sturdy, dark green. Pods dark green, 4 inches long, fairly broad and pointed.

Little Marvel. (Wrinkled). If a fine crop of early, choice Peas is desired, Little Marvel is just the variety to plant. The vines average 15 inches in height and bear an abundance of pods, usually in pairs. The pods are about 3½ inches long and are well filled with quite large, deep green Peas of delicious flavor. It is fully as early as American Wonder, but the pods are larger and the crop heavier. Matures in 57 days.

Sutton's Excelsior. (Wrinkled). A splendid Pea for the home garden. As early as Nott's Excelsior with larger pods that are well filled with large, sweet peas. Height 1½ feet.

Laxton's Superb. An early dwarf variety of the Laxtonian type. Vines 15 to 18 inches high, vigorous and very productive. Foliage light yellowish green. Pods large, rather broad, slightly curved and of medium dark green color. It is hardy and can be sown very early, the seed being semi-wrinkled is not as likely to rot during unfavorable weather conditions as the fully wrinkled sorts. Recommended as an excellent sort for the home and market garden.

World Record. For home and market gardeners use. Vine 24 inches high, fairly stout, and medium green. Pods 3½ inches long, broad, pointed. This is an improved Gradus type of fine quality.

Laxtonian. (Wrinkled). Another good dwarf variety which matures its crop about a week later than the very early sorts. The vines grow about 1½ feet high and are very sturdy and vigorous. The pods are unusually large and are filled with large, luscious peas. A heavy yielder. Matures in 57 days.

Alaska.

PEAS—Continued.

Laxton Progress. The earliest, large-podded, dwarf, sweet Pea. Vine 16 inches high. Pods 4 inches long, broad, pointed, dark green in color. Excellent quality.

Little Gem (Premium Gem). (Wrinkled). A dwarf variety that is enormously productive. The vine grows 18 inches high and the pods are borne on both sides of the plants. The Peas are of medium size and excellent quality.

Nott's Excelsior. (Wrinkled). One of the most popular of the extra early varieties, especially with market gardeners. It is a close, compact grower, with 3-inch pods tightly filled to the very end with large peas of exceptionally sweet flavor.

Thomas Laxton. (Wrinkled). Four days later than Gradus and identical in growth, but the pods are a deeper, richer green and are square at the end. Thought by many to be even sweeter and finer in flavor than Gradus. Matures in 56 days.

Late Peas

Alderman. (Wrinkled). This variety must be supported by brush or trellises, as it reaches a height of 5 to 6 feet. The plants bear a profusion of large pods which contain 7 good sized, elongated, dark green peas of excellent quality. Matures in 70 days.

Bliss' Everbearing. (Wrinkled). Yields an abundance of large pods filled with good sized peas. A fine variety.

Dwarf Telephone (Carter's Daisy). (Wrinkled). Resembles Telephone in everything but height, which is 18 inches. A very good sort.

Potlatch. (Wrinkled). The best extremely late dwarf Pea on the market. The vines are very vigorous and healthy, bearing an abundance of deep green pods, sometimes in pairs, and often containing on an average of seven fine large peas of exquisite flavor. In ordinary seasons it bears continuously from July 1 to 15. Matures in 90 days.

Telephone. (Wrinkled). An extremely valuable variety because of its long bearing season. The vines are very vigorous in growth, reaching a height of 3½ feet, and bearing an average of 18 to 20 pods to a stalk. The pods are of large size and contain 6 or 7 peas closely packed, of pale green color and delicious flavor. Matures in 65 days.

Champion of England. (Wrinkled). This popular old variety is still largely planted because of its rich flavor. It reaches a height of 4 to 5 feet. The pods are well filled and are borne in profusion.

Improved Stratagem. A splendid late Pea. Foliage and pods dark green. Pods about 4 inches in length, well filled with large peas of best quality. Height 2 feet.

Marrowfat, White. A white-seeded variety of the famous old Marrowfat which almost everybody knows. A strong grower and yields heavily.

Sugar Peas

This class of Peas is cooked without removing the pods and makes a most delicious vegetable dish. The pods are very tender and exceedingly sweet when young.

Dwarf White. Very similar in habit to the American Wonder, being unusually dwarf. Despite its small size it bears good sized pods which are beautifully crimped and of exquisite melting flavor. One of the best sorts and a variety that has been largely planted. Smooth white seed.

Mammoth Luscious. The largest, sweetest, and most desirable of the Sugar Peas. They reach a height of 5 feet and are literally covered with large, broad pods which are so brittle that they snap without any string. When cooked the pods are very sweet and tender. Large, wrinkled brown seed.

Telephone Peas.

Dwarf Gray Sugar. A gray-seeded variety. The vines grow about 15 inches high, producing a heavy crop of small, flat pods about 3 inches in length. Just the variety to plant where a dwarf sort is desired. Grayish brown seed, smaller than Mammoth Luscious.

Mammoth Melting Sugar. The pods of this variety are so brittle that they snap without any string. The plants grow to a height of 5 feet and bear a profusion of large, broad, delicious pods. One of the best Sugar Peas, and should have a place in every garden, however small. Smooth white seed, resembling Marrowfat, but larger.

Champion Moss Curled Parsley.

Parsley

One ounce will sow about 150 feet of drill.

The leaves of Parsley are used for garnishing and flavoring. Seed resembles that of celery, but larger and dark grayish green. After soaking for a few hours in tepid water, to hasten germination, sow in rich, mellow soil, in drills one foot apart and one-half inch deep. Thin out the young plants to 4 inches apart. Give Hamburg Parsley the same culture as carrots.

Champion Moss Curled. The dark green leaves are very finely curled, making it very attractive for garnishing or for border planting.

Hamburg or Rooted. The roots of this variety are used in flavoring soups and stews.

Improved Hollow Crown.

Parsnips

One ounce will sow about 200 feet of drill.

Parsnips thrive in rich soil, deeply dug. Seed flat, thin, round, greenish yellow, one-eighth to three-sixteenths inch diameter. Sow a half inch deep, in drills 18 inches apart, as soon as the ground can be worked. The roots are improved by frost, and as they are very hardy, may be allowed to remain in the ground all winter.

Improved Hollow Crown. The roots are of medium length, with a broad shoulder which gradually tapers downward. The skin is white, smooth, and attractive, and the flesh is sweet, fine grained and tender. Good for table use or stock feeding.

Peppers

One ounce will produce about 1,000 plants.

Pepper seed is light yellow, about shape of tomato seed, but flat, hard, and about one-eighth inch diameter. It may be sown in the hotbed in March or April, and later transplanted to 3-inch pots until the ground is warm enough to permit of setting in the garden. Set plants 3 inches deeper than they were in the pots and 2 feet by 18 inches apart in the drill. Sow seed outdoors after all danger of frost is past, four or five seeds to the hill, and at distances above given. Thin to one plant when well up.

Bullnose (Large Bell). The fruits of this early, prolific variety sometimes reach a length of 3 to 4 inches. The flesh is thick, solid, and milder and sweeter than most other sorts. Fine for stuffing.

Chinese Giant. The largest Pepper in cultivation, averaging 12 to 15 inches in circumference. The flesh is sweet, very tender, and thick; fine for stuffing. Brilliant scarlet when ripe; profuse bearer.

Harris' Early Giant. The best of the large Peppers and one of the earliest. Very prolific; dwarf, compact growth. Scarlet fruit growing to 5 inches in length by 3½ inches in diameter; three-lobed, mild and sweet.

Long Red Cayenne. The fruits are very hot, and are principally used for seasoning. Bright red; about 4 inches in length. Very productive.

Ruby King.

Ruby King. Resembles Bullnose. Fruits average 4 to 6 inches in length, ruby-red in color. The flesh is thick, white, and so mild in flavor that it can be sliced and eaten like tomatoes or cucumbers.

Sweet Mountain. Another variety that resembles Bullnose, but is larger, sweeter, and of milder flavor. Plants vigorous and productive.

PEPPERS—Continued.

Pimiento. The fruits of this very productive sort are exceptionally smooth and glossy, of good size, medium length, and attractive color. The flesh is very thick and solid, mild and of very fine flavor. Desirable not only for salads and stuffed Peppers but it is also the sort used largely by canners. The plants are vigorous and upright, about 2 to 2½ feet high, with short, broad, dark green leaves. The fruits are deep green when young, becoming deep red as they mature.

King of the Mammoths.

Pumpkins

One ounce will plant about 50 hills.

Plant the seed in April or May, in hills 6 by 6 feet or more, in the garden, using nine or ten seeds to a hill and thinning to the best three when the plants are well up. Pumpkins may also be grown among the hills of corn, when the seeds should be planted 9 or more feet apart each way.

Connecticut Field. One of the best for field planting, being largely grown for stock feeding. Seed about same as that of Small Sugar but cleaner.

Green Striped Cushaw. The rich yellow, close-grained, sweet, tender flesh of this variety has made it a great favorite. The skin is striped with mottled green bands of creamy white. Seed white, velvety, wrinkled.

Large Cheese (Kentucky Field). This variety is particularly prized for the home garden because of its thick, fine flavored flesh and good keeping qualities. It is a large, round, flattened sort with creamy buff skin and averages about 2 feet in diameter. Small seed, hard to clean.

King of the Mammoths. The popular exhibition Pumpkin that usually is the prize-winner at the fairs. It is not unusual for a specimen to weigh 250 pounds. The skin is salmon-orange, with very thick, bright yellow flesh which is fine grained, tender and of fine quality. To secure the largest fruits, only one vine should be grown to a hill, allowing but one fruit to mature on a vine. Seed large, white.

Small Sugar (New England Pie). One of the best pie Pumpkins. The fruits are but 10 inches in diameter, but what they lack in size they more than make up in quality. Flattened and slightly ribbed, with sweet, deep orange-yellow flesh. An excellent keeper. Seed white, velvety, mealy, medium size.

Radishes

One ounce will sow about 100 feet of row.

Radishes like a soil that is open, warm, and quick. All Radish seed is dark yellowish brown with a purple cast, semi-round, resembling small pebbles, and averaging 1/32 to 1/8 inch in diameter. Sow seed of the early round or olive-shaped varieties as early in spring as the ground can be worked, one-half inch deep, in rows 12 to 18 inches apart. Seed should be sown thinly, and if plants come up closer than one inch, they must be thinned out. Sow at intervals for succession until about the middle of May when the long sorts should be sown; about July 1st, the winter varieties.

Round Varieties

Crimson Giant. This variety grows twice the size of the other round sorts and still remains solid. It often reaches a diameter of 6 to 7 inches without losing its juiciness or becoming pithy. The roots are round to oval in shape and crimson in color, with mild, tender flesh. It may be used for forcing or early spring planting.

Early Scarlet Turnip. Largely used for open-ground planting. It is a quick grower of round form, and has mild, crisp flesh. A very early sort.

French Breakfast. A desirable variety for forcing and early planting outdoors. It is of oblong shape, bright pink above and white below, with mild, tender flesh.

Vick's Scarlet Globe. Good variety for forcing or sowing outdoors. The Radishes are of an attractive scarlet color, with sweet flesh that does not soon become pithy. A very early sort.

Scarlet Turnip White-Tipped. Very popular market sort because of its attractive appearance. The Radishes are very deep scarlet in color, with white tip. Flesh white and of fine quality. A great favorite for early planting outdoors.

Cooper's Sparkler, White-Tipped. A comparatively new variety. Globular in shape; rosy carmine, with white tip; solid and crisp; very short top. This is a splendid variety and very popular on many markets.

Vick's Scarlet Globe Radishes.

Icicle
Radishes.

Salsify - Vegetable Oyster

One ounce will sow about 50 feet of drill.

Salsify succeeds best in a light, well enriched, mellow soil. Seed a yellowish gray pod, about one-half inch long, resembling a banana in shape. Sow seed in early spring, one inch deep, in rows 12 inches apart, thinning out the young plants to 6 inches apart. The roots will mature by October, when they should be stored for winter use like Carrots. Roots may also be left in the ground until spring. Makes a very delicious vegetable dish when stewed and served with cream dressing.

Mammoth Sandwich Island. A tender delicious variety that is far superior to other sorts. The roots are large, thicker, and grayer, and the leaves are larger and greener. Very mild and delicately flavored. This is the variety that is so largely planted by market gardeners, and as it becomes better known, will find a place in every garden.

We carry a complete line of Garden and Flower Seeds and if you do not find what you are looking for, ask for it. We will get it for you.

Long Radishes

Chartier. Twice the size of Long Scarlet, but resembles it somewhat. The roots are long, of attractive crimson color, tipped with white. The flesh is white, crisp and well flavored.

Icicle. Grows more popular every year. It can be used as a summer Radish or forced in frames. The roots are 4 to 5 inches long and $\frac{1}{2}$ to $\frac{3}{4}$ inch in diameter. They mature earlier than any of the other white Radishes, and are very attractive, being pure white, almost transparent, and very tender.

Long Scarlet Short Top. Matures 25 days after planting. Long, slender, red Radishes with crisp flesh. Good forcer.

Long White Vienna (Lady Finger). A good sort to follow the Icicle, for if planted at the same time as that variety, will mature when the Icicle crop is exhausted. Very crisp and tender.

White Strasburg. The smooth, pure white roots measure 4 to 5 inches long and about 2 inches in diameter. The flesh is white, mild and sweet.

Winter Radishes

California Mammoth White. Fine winter variety. It grows to a large size, with firm white flesh of good flavor. An excellent keeper.

China Rose. Sown in the fall, the seed will produce 5-inch roots of deep rose color which will keep well into the winter. The pure white flesh is very firm, compact, and pleasingly pungent.

Long Black Spanish. A good winter variety. Plant in the fall. The skin is almost black, but the flesh is pure white and very sweet.

Celestial. This excellent variety is sold also as Chinese White Winter. The roots are long, cylindrical, with beautiful white skin and flesh, the whitest and usually the least pungent of the winter varieties. When fully mature the roots are 6 to 9 inches long by about $2\frac{1}{2}$ to $3\frac{1}{2}$ inches in diameter. The flesh is solid and crisp.

Salsify.

A vegetable garden will cut your grocery bill in half.

Sage

A perennial herb much used in cooking. It prefers an open, sunny situation and well drained mellow loam. Sow seed in the seedbed outdoors as soon as the ground becomes dry enough, about one-half inch deep. When plants are 2 to 3 inches tall, transplant in rows 10 inches apart, 15 inches apart in the row.

Broad-Leaved. This is the variety that is most largely grown. It produces an abundance of its broad green leaves, which are used for seasoning and medicinal purposes when dried.

King of Denmark Spinach.

Spinach

One ounce will sow about 100 feet of drill.

Spinach demands rich, light soil. Sow seed in early spring, one inch deep, in rows 12 inches apart, and make additional sowings every two weeks for a succession. For fall use sow in August, and for a winter crop, in September.

Bloomsdale (Savoy-Leaved). This variety has wrinkled leaves, like the Savoy cabbage. It is the hardiest variety and produces a profusion of thick, fleshy leaves which are curled and crimped. Seed greenish yellow, about size of radish seed.

Thick-Leaf. One of the best market sorts. It is very slow in running to seed and produces an abundance of heavy, crimped, dark green leaves. Seed like that of Victoria.

Victoria. Fine for spring sowing and very slow to run to seed. The dark green leaves are fleshy and crimped. Seed small, yellowish green, about size of radish seed.

King of Denmark. The longest standing Spinach, continuing in edible condition for 60 days. Long, very thick, dark green leaves. Admirable as a successor to the sorts generally cultivated, remaining fit for the table long after all others have shot to seed.

New Zealand. Unlike other varieties, this Spinach is tender and dies down with the first frost. If started early in the spring, the plants will make a strong growth during the summer. The stems and leaves are soft and thick, and if the leaves are picked from the stems, the plants will supply an abundance of delicious greens all summer. Seed large, brown, sharp pointed and irregular in shape. This variety is used by market gardeners to supply summer Spinach.

Early White Bush.

Summer Crookneck.

Squash

One ounce of early Squash seed will plant about 25 hills;

1 ounce of Marrow Squash, about 50 hills.

The Squash requires a good, rich soil. Plant seeds of Bush Squashes in hills 3 to 4 feet apart, 8 or 9 seeds to a hill, and thin out to four plants when danger of bugs is past. Sow vining sorts 6 to 8 feet apart each way.

SUMMER VARIETIES

Early White Bush Scallop (Pattypan). A good shipping sort which matures early. The flat scalloped fruits are creamy white in color, uniformly large, and of good quality. Seed small, yellow, resembling seed of Summer Crookneck.

Summer Crookneck. An early variety with extra large fruits, often measuring 18 inches to 2 feet long. The flesh is of good quality and rich yellow color. Seed yellowish white, about size of watermelon seed.

Table Queen (Des Moines or Acorn). A trailing vine sort, with small, acorn-shaped fruit having a very thin, distinctly ribbed, dark green shell and measuring 6 inches long by 4½ inches in diameter. Flesh bright yellow, of fine flavor.

Table Queen.

FALL AND WINTER VARIETIES

Boston Marrow. Fine for fall and winter use, as it is a very good keeper. The fruits are oval in form, with bright orange-yellow skin and yellow flesh. Excellent for pies. Seed large, white, velvety.

Chicago (Warted Hubbard). The largest and best of the rough-skinned Hubbards. It is a strong, vigorous grower, with large, heavily warted fruits of fine form and rich dark green color. The flesh is very rich and dry. Fine for the home market. Beautiful white seed, same as True Hubbard, some larger.

Delicious. Reaches a weight of 5 to 10 pounds; at its best in mid-autumn and early winter. Without a rival in fineness and compactness of grain, dryness, sweetness, and extreme richness of flavor. Fruits vary in form and color, but the dark orange flesh is always delicious. Small, white, wrinkled seed.

Golden Hubbard. Fine for the home garden, being one-third to one-half smaller than the True Hubbard. The flesh is deep golden yellow, of fine flavor, and cooks dry. Large, fleshy, white seed.

True Hubbard. A fine keeper and popular as a home and market garden variety. The fruits are large, olive-shaped, with dark green skin and very rich flesh. An old standard sort that is very largely planted. Seed pure white, large and fleshy.

Tomatoes

One ounce will produce about 1,000 plants.

All Tomato seed is flat, yellow, fuzzy, semi-solid and about one-sixteenth inch in diameter. For a small garden, sow a few seeds in a shallow box or flower pot the beginning of March, and place in a sunny window. About May 15th, set plants in the garden, 3 feet apart each way, watering freely at time of transplanting. If a large area is to be planted, sow seed in the hotbed in rows 5 inches apart and one-half inch deep. When 2 inches high, transplant, 4 inches apart, to another hotbed, or in 4-inch pots, one plant to a pot, again transplanting to the open the middle of March.

Chalk's Early Jewel. Matures a week later than Earliana.

The fruits are very uniform in size, of brightest red, and very solid. It produces its large fruits continuously through the season, and for quality and quantity easily takes first place among the extra early varieties.

Bonny Best. A vigorous growing sort of spreading, upright habit, and having large, smooth, deep green foliage. The fruits are of good size, weighing 5 to 6 ounces each, and are borne in clusters of three to five. In shape they are rather flattened, but smooth and do not crack. The skin is a solid red right up to the stem, and the flesh is dark red, of fine texture and flavor, and slightly sub-acid.

Matchless. One of the heaviest yielders and a fine main or general crop sort. The beautiful, cardinal-red fruits are very large, solid, and meaty, with few seeds. It is particularly recommended for short market shipments, as it is not quite so solid as the Stone. It also has the added merit of retaining the size of its fruits late in the season.

John Baer. The introducer claims that this is one of the very earliest Tomatoes originated up to date. In addition to its earliness, it has the added merit of being an enormous yielder, producing 50 to 100 fruits to a plant. Strong plants, grown in paper pots and transplanted without disturbing the roots, will produce ripe Tomatoes in 30 days. The fruits are perfect in shape, solid, high crowned, and of a beautiful brilliant red.

Marglobe. A disease resistant type, developed by the U. S. Department of Agriculture. Fruits are large, smooth, globular, meaty and almost coreless. Plants very productive, medium large and erect, shading the fruit well to prevent sun scald. A good sort for market gardeners and canners as it is second early in maturing.

Marglobe Tomato.

Dwarf

Stone.

Earliana. A very early and productive sort, with deep red fruits crowded in clusters all over the plant. The fruits are very uniform in size, averaging 3 inches in diameter and 2 to 2½ inches deep. The flesh is solid, with few seeds.

Matchless Tomatoes.

Dwarf Champion. A compact, upright grower that bears a profusion of medium-sized, purplish pink, smooth, symmetrical fruits.

Dwarf Stone. Fine for the home garden because of its dwarf, compact habit. The fruits are freely borne in clusters of three to five, and average 4 inches in diameter and 2½ inches in depth. They are bright red in color, smooth, and solid.

Ponderosa (Beefsteak). The largest Tomato yet introduced, frequently weighing a pound or more. The fruit is deep purple in color, slightly reddish, with very solid, luscious flesh and small seed cells. Fine for the family garden and for the market. A fine slicing Tomato, being very fleshy.

Stone. One of the best main crop, red Tomatoes. The fruit is large, smooth, bright scarlet, of fine quality, having little core. A heavy yielder of uniformly large fruits, and has proved to be a tremendous money maker everywhere. Fine for canning or the home garden, and long considered the standard main crop Tomato for all purposes.

Rutabagas.

Rutabaga or Swede Turnips

American Purple Top. Has the good quality of growing to a very large size and yet remaining solid and fine grained. The yellow roots are purple at the top and oblong in shape, with short tap root, and the flesh is deep yellow, mild, and sweet. Keeps well until spring. Seed resembles that of turnips.

Tobacco

Tobacco seed is very fine and brown in color. For early crop, sow in hotbed or broadcast in rich, dry soil as soon as it is warm, pressing it down firmly and covering lightly. Water frequently. Set plants out about June 1st, 3 feet apart each way.

Connecticut Seed-Leaf. An old, well known variety that is largely planted and used for cigar wrappers.

Sweet and Medicinal Herbs

Sow during May or June, in drills one foot apart, covering very lightly and when well up thin out or transplant to 6 inches apart in the row. Cut these plants before in full bloom, tie in bunches, and hang in the shade to dry, after which place in boxes or bottles for winter use.

All Herb Seeds, 5c per pkt.

Caraway. For flavoring liquors or bread.

Chervil. Used in soups and salads.

Chives. Used in seasoning.

Dill. Used in flavoring vinegar.

Lavender. For oil and distilled water and making sachets.

Marjoram. Used in seasoning.

Rosemary. Used in seasoning.

Sage. Used in seasoning and as a medicine.

Savory. Used in seasoning.

Sorrel. Can be used like spinach.

Sweet Basil. Used in seasoning.

Sweet Fennel. Used in flavoring.

Thyme. Used in seasoning.

Turnips

One ounce will sow about 150 feet of drill.

Turnip seed resembles very much that of cabbage. For an early crop of Turnips, sow as soon as the ground is warm in the spring. Sow Rutabagas from July to August 1st. For winter use, sow from the middle of July to end of August. Both Turnips and Rutabagas are usually sown broadcast, but larger crops will result if cultivated in drills 18 inches apart, thinning to 6 inches apart in the drill.

White Varieties

Cowhorn (Long White). Mainly used as a stock food, but of excellent quality for table use. It is a rapid grower, and is fine for turning under with crimson clover as a green manure crop. The roots are large, long, of carrot shape, and grow partly above ground.

Purple Top Strap Leaf. A standard early variety. The roots are white, with the upper portion deep, purplish red. They are quite flat, 4 to 6 inches in diameter, and have fine grained, sweet, tender flesh.

Purple Top White Globe. An excellent keeper and fine to grow for stock feeding as well as for table use. The Turnips measure 6 inches and more in diameter, and are of perfect globe form. They are clear, creamy white below and rich purplish red above. The white flesh is firm, crisp, and of mild flavor.

White Egg. An egg-shaped variety that grows to good size and matures very quickly. The skin is thin and white and the flesh solid and fine grained. Fine for either spring or fall planting and a very good keeper.

White Flat Dutch Strap Leaf. Good for spring planting. The skin is creamy white and the flesh mild, sweet flavored, and of superior quality, being firm and crisp.

Yellow Varieties

Aberdeen Yellow. Large, smooth roots of perfect globe shape with rich yellow skin and flesh of excellent quality.

Robertson's Golden Ball. The round, deep low roots are medium in size, very firm, and of excellent flavor. A good keeper and fine for the table or for stock feeding.

Purple Top Strap Leaved Turnip.

Flower Seeds

No home is complete without its flower garden, even if it is of small size. If there is but room for a vegetable garden, plant flowers along its edges. They will add to the appearance of the garden and cheer the gardener in his work by their bright colors. A careful selection of flower seed will insure a succession of bright colored blooms from early spring until late fall. The following are the best of the flowers for all season bloom.

Antirrhinum - Snapdragon

For continuous bloom from early summer to frost, there is no perennial that equals the Antirrhinum, or Snapdragon. It produces a profusion of richly colored spikes of bloom that are unexcelled for cutting as they last a long time in water. While a perennial, seed sown early in spring will produce blooms the same year, but if earlier blooms are desired, seed should be sown under glass in February or March. They vary in color from white through all shades of pink to the deepest garnet, yellows, and numerous combinations of color. Average height 2 feet.

Bachelor's Buttons

One of the prettiest of our blue flowers which also comes in a pure white and a rose form. Everyone knows the "Cornflower," another name given it. It is very hardy, of the easiest culture, and a profuse bloomer.

Balsam

This is more familiarly known as the "Lady's Slipper," and is so well known as to need little description. Seed sown in May will soon produce handsome bushes

Branching Asters.

Antirrhinum.

covered with large roselike flowers of pink, red, yellow, white and various combinations of colors. Height 1½ feet.

Ageratum

One of the best of the annuals, and indispensable in every flower garden for contrast with such plants as geraniums, alyssum, candytuft, and the like. They vary in color from pure white to blue and rose, and the dwarf blue sorts are excellent for border planting. Thrives in almost any soil and location and blooms the whole season. They vary in height from 5 inches to a foot, and the fluffy flowers are borne in full clusters.

Asters

One of the most popular garden flowers because of its beautiful blooms and its ability to thrive in any soil. It is a profuse bloomer and its blooms are as lasting as those of the chrysanthemum and equally lovely in color. Sow seed ½ inch deep in open ground for plants which will bloom in September and October. Transplant, when plants have three or four leaves. 12 to 18 inches apart each way. For July and August flowers, sow in March or April, in the cold frame or in pots or boxes indoors. Our seed is composed of the best selected strains and will produce blooms of all shades—crimson, dark blue, light blue, pink, and white.

Sweet Alyssum

The extreme hardiness and free-flowering qualities of this annual have combined to make it most popular. It is excellent for borders, baskets, pots, rockwork, and cutting. Sow in masses in the garden early in the spring, or even the previous autumn. If cut back after the first flowers fade, others will come. It produces an enormous quantity of either yellow or white flower-heads in a season.

Calendula

This hardy annual will supply the brightest colors in the garden from seed sown in early spring. The blooms—red, yellow and orange in color—are borne on long stout stems, and are excellent for cutting. Blooms profusely all season, until late autumn. Height 1 foot.

California Poppy

A most effective hardy annual when planted in masses. The plants average a foot in height and are covered with large pure yellow, poppy-like blooms from early spring to frost. Easily grown in all localities.

Candytuft

One of the best hardy annuals for bedding, edging, massing, rockeries or cutting. They are profuse bloomers with white, pink, carmine and purple flowers. If sown outdoors at intervals, from April to July, a succession of bloom may be had until fall. They demand rich soil and plenty of water.

Carnation

The Carnation is one of the hardiest of our perennials and will come through the winter uninjured. It is easy to grow and blooms all season. Seed planted early in the spring will produce blooming plants the second summer. The blooms are richly colored and have a delightful spicy fragrance. Height 1½ to 2 ft.

Clematis

An excellent hardy climbing perennial for trellises, arbors, verandas and the like. It thrives in most locations and produces an abundance of fragrant white or purple, star-shaped flowers. Height 10 to 20 feet.

Cockscomb

For ease of culture and brilliance of color few annuals surpass the Cockscomb, or Celosia. They produce large flower heads or "combs," bright red or yellow in color, all through the season, and are unsurpassed in the border. Height 1 foot. The "Ostrich Plume" varieties produce large, showy bright colored plumes, curled and curved, like an ostrich plume, and are 2 to 3 feet in height.

Cosmos

One of the best of the fall-blooming annuals. It is a strong, tall grower, reaching a height of 4 to 6 feet. The dainty crimson, pink, or white flowers are borne in great profusion, and are most effective with their setting of feathery green foliage. Fine for broad masses, or long background borders against evergreens and fences. For early flowers, start indoors and transplant to dry, sandy or poor soil in a sunny location.

Candytuft.

Foxgloves.

Dahlias

Everyone knows and loves the Dahlia, for its blooms come at a time when the flower garden is beginning to look ragged, and they continue in profusion until cut down by frost. There are no richer colors than will be found in Dahlia blooms, and they come in a variety of forms—single, semi-double, double, cactus, and col-larete varieties. Many persons do not know that these beautiful flowers can be secured from seed sown in early spring, but this is the case. Bloom in late summer and continue until late fall. Height 3 to 6 feet.

Foxgloves

One of the most showy of the hardy perennials, but most satisfactory when treated as a biennial. Sow the seed outdoors in spring and transplant the seedlings to their permanent places. They will bloom magnificently the following spring, giving an abundance of flower spikes 2 to 3 feet high. They are particularly effective when grown among shrubbery, in masses, or as a background for lower growing plants. The colors are rich and attractive, such as purple, rose, white and yellow, all with throat mottled with darker colors.

Forget-Me-Not

There is no daintier plant than the Forget-me-not, and it gives an abundance of bloom in early spring and fall. It thrives in a cool, moist situation and establishes itself by self-seeding, never reaching a greater height than 8 inches. It is excellent for borders and edgings. The blooms are white, pale blue, indigo-blue or rose in color.

Four O'clocks

A handsome, free-flowering, sweet scented, half-hardy annual of the easiest culture, opening its blooms at 4 o'clock, hence its name. It makes a splendid display when planted in masses in beds and borders, for it blooms profusely, and the flowers vary in color from white, yellow and red to variegated and striped forms that are very showy. Height 2 feet.

Gaillardia

Both the annual and perennial varieties are free bloomers all summer until frost and their showy blooms are large in size, very lasting, and excellent for cut flowers. They thrive in any situation and are easily grown. In color they are mostly red or yellow, or combinations of those two colors. Height 2 to 3 feet.

Gaillardia.

Heliotrope

The Heliotrope has long been a favorite because of its delightful fragrance. It can be grown from seed and will bloom the first season. The small flowers are borne in clusters and are mostly lavender and white. Succeeds best in light, rich soil. Height 1½ feet.

Hollyhock

The Hollyhock has been grown in our gardens for many years, but the old varieties cannot compare with the newer improved sorts in beauty of coloring and doubleness of bloom. They are fine for the background of the border, where their lovely spires of varicolored blooms show to best advantage. The colors range from white to deepest maroon, many shades of yellow, salmon, and some with darker centers. While Hollyhocks are hardy the first winter and very per-

Larkspur.

manent, it is best to sow seed every year, as the flowers on the young, vigorous plants are finer than on the older plants. Height 6 feet.

Larkspur

This is another good blue annual for the flower garden, but there are also lovely pink shades and pure white. The flowers are borne in long narrow spikes and sometimes a second crop of bloom is produced in a season. They are very easily grown and are lovely to combine with lilies or other flowers in beds, borders and masses. Sow seed outdoors in early spring and thin seedlings to stand 6 to 18 inches apart.

Marigold

Among the most brilliant of our hardy annuals, the Marigolds are a decided addition to any garden. They are very hardy—anyone can grow them—and their large, very double blooms vary in color from lemon-yellow to orange-yellow, providing a bright spot in the garden far into the frosts of autumn. Height 1 to 2 feet.

Mignonette

If successive sowings of Mignonette seed are made, its modest colored, fragrant flowers may be gathered outdoors until November. Its pleasing, pungent fragrance is its greatest attraction, and it is largely used in making bouquets. The improved varieties have far larger flower spikes than the old sorts, and the blooms are golden yellow, deep red, coppery scarlet and white.

Morning Glory

A climber of quick and most luxuriant growth, some varieties reaching a height of 40 feet. There is nothing finer for porches and trellises, where it is desired to obtain quick results, and there is no vine more easily grown. The attractive, heart-shaped foliage and large, bell-like flowers combine to make this one of our best vines. The flowers come in many variations of blues and purples and intermediate shades from white to carmine. Soak the large, thorny seeds of some varieties in water before planting.

Nasturtiums.

Nasturtiums

The Nasturtium thrives in the poorest of soils and produces a profusion of blooms until frost. If planted in rich soil, an abundance of leaves is produced, but very few flowers, and the plants are liable to rot off in wet weather, especially if grown too close. No other hardy annual produces such an abundance of rich and brilliantly colored flowers, for so long a season, and with so little care. The colors range from creamy white to bronzy brown, with all the intermediate shades of yellow and orange, some marked with deep maroon and others solid maroon in color.

Dwarf. Two months from sowing, these neat, compact plants are covered with gorgeously colored flowers, and they continue to bloom the entire season. The foliage is very attractive and the plants rarely reach a height of more than 1 foot.

Tall. These reach a height of 8 to 12 feet and are fine for trailing over stone walls, trellises, fences, and the like; they can also be grown as pot plants for winter blooming, as screens, or as trailers for hanging baskets and vases. The gorgeous coloring of their blooms and their long season of flowering place them among the most important plants for the garden and home grounds.

Petunias

As a continuous bloomer there is nothing to excel our Petunias. Their colorings are rich, and in size they vary from an inch to five or more in diameter, and from single to very double. They will thrive in any soil if they receive plenty of sunlight. Sow seed in the house or hotbed in February or March, or in the garden as soon as the ground is warm.

Pansies

These old favorites have won a place for themselves in every heart, and no flower garden is complete without them. They are one of the best annuals for the small city garden as well, for they bloom incessantly the whole season long. Our mixture contains seed which will produce large blooms of all colors, with a variety of markings and many odd shades, that have been originated recently, and add much to the general color effect. If plants are wanted for bedding early outdoors, sow seed in the cold frame from August to October. Seed sown in a cool, moist place in June and July will give good fall blooming plants.

Phlox

One of the easiest grown annuals, and also one of the most satisfactory for planting in masses of contrasting colors, when they present a dazzling effect. Few desirable colors are missing in their range, and their bloom heads are borne over a long season. Make the first sowing as soon as the frost is out of the ground, and transplant where they are to bloom. If first flowers and seed pods are cut, the plants will become more bushy and will bloom for a longer time. Plants average about 1 foot in height.

Poppy

Sow seed thinly, where they are to bloom, and cover very lightly. When the plants are up, thin to stand one foot apart. By successive plantings, blooms may be had all summer. Color varies from pure white to deepest reds, and many shades of yellow. Height 2 to 4 feet.

Portulaca

An excellent, low-growing annual that thrives under all conditions, but a sunny location and light, sandy soil suit it best. It flourishes in the hottest, driest seasons, and in the forenoon is covered so profusely with its brilliantly colored blooms as to completely hide the foliage. The double varieties are so full and perfect that they resemble tiny roses. The colorings are very brilliant—deep golden yellow, rich rose, crimson, scarlet, purple and white. Sow seed late as it does not germinate until hot weather.

Pansies.

Salpiglossis.

Ricinus - Castor Bean

The well known Castor Oil Plant which appears on so many lawns. It is unequaled for producing semi-tropical effects. As a specimen it makes a perfect pyramid of gigantic leaves which are green, dark maroon, dark brown, or dark red, many with contrasting stems. The taller varieties grow 8 to 10 feet high, with leaves several feet across and beautifully lobed. This half-hardy annual is very easily grown.

Salpiglossis

Few half-hardy annuals give such a wealth of bloom in so many rich and varied colors as do these "Painted Tongues," the name given them in many localities. They bloom profusely from late summer until frost and the beautiful funnel-shaped flowers have dark veins on a ground which varies from white to crimson, yellow, orange and many intermediate shades. Very easily grown. Height 2 feet.

Salvia - Scarlet Sage

One of the best known annuals, Salvia or Flowering Sage, as it is better known, keeps the garden bright with color until late autumn. The flowers are borne in erect spikes—white, blues and reds. The red variety is the more largely planted, but the others are very attractive. Grows and blooms profusely in any light, rich soil. Height 2 to 3 feet.

Scarlet Runner Bean

A very attractive climber with bright scarlet flowers. It is a rapid grower, attaining a height of 10* to 15 feet in a season, and is densely covered with foliage, making it an excellent variety to plant where shade is desired. The bright red flowers, which are borne from July to September, are followed by edible beans of excellent quality, both when shelled and when dried.

Snapdragon. See Antirrhinum, page 24.

Shasta Daisy

A very popular florists' flower but can very easily be grown in the home flower garden. It is a hardy perennial reaching a height of 2 to 2½ feet and bears a profusion of extra large white flowers having brilliant golden yellow centers. Sow seed where the plants are to flower and thin out to 8 to 10 inches apart. Blooms all season.

Stocks

Few flowers have as many good characteristics to recommend them as have the Stocks. Their good habit, fine foliage, beautiful and fragrant flowers, long season of bloom, and adaptability to almost any location—all commend them to the flower lover. The flowers come in many shades of red and pink, dark blue, light blue, white, violet and yellow. If early flowers are desired, sow under glass in March or April and transplant when an inch high to pots or boxes, again transplanting in March, a foot apart, to beds in the open. For later flowers sow seed in the open in May. Height 1 to 1½ feet.

Sweet Peas

These lovely flowers are steadily growing in popularity, and each year sees great improvement in color, shape and number of blooms to a stem. They require a deep, rich, moist soil, and if this is not obtainable, a trench one foot deep and one foot wide should be dug, removing all poor soil and replacing with rich soil from another location. It is claimed that the trench method produces the best results, even if the soil is rich. Sow the seed plentifully, about 2 inches deep, and, as the vines grow, fill up the trench with soil and thin to about 2 to 3 inches apart. Sow in spring, as early as ground can be prepared—St. Patrick's Day is a popular date.

Fancy Mixed. A mixture of named varieties in all colors, from dark maroon through all shades of red to pink and white, and from dark blue and purple to lighter blues and lavender, also yellow and buff.

Spencer. These are sometimes called the "Orchid-Flowering Sweet Peas." They have very large flowers with waved or fluted petals. A great improvement on the old variety of Sweet Peas, with all their beautiful coloring.

Sweet Peas.

Sunflower

Too well known to need description here, the Sunflower has an important place in background and screen planting. To the old common varieties have been added many new and attractive sorts having double blooms and silvery or variegated foliage. The blooms, differ in color, some being red and yellow, and others varying shades of yellow. Height 3 to 5 feet.

Verbena

These well known annuals have long been popular because of their hardiness, profuse growth, and free-blooming qualities. A single plant, in rich soil, will often carpet a space 3 to 4 feet in diameter. They are particularly fine for window boxes, borders, beds, mounds and the like. Plants grown from seed are less expensive, produce more flowers, and are more vigorous than those grown from cuttings. For early spring bloom, sow in February under glass, for later flowers sow in March and April. Transplant to other boxes when about an inch high, setting out in May, 10 to 15 inches apart each way. The blooms are produced in profusion from early summer until frost, and vary in color from pure white to bright blue, scarlet and yellow.

Zinnia

One of the most easily grown of all the hardy annuals, and few equal it in profusion and continuity of bloom. Seed sown early in spring will produce plants 1 to 2½ feet in height, covered all season with large, double flowers in every color except blue.

Verbena.

Planting Calendar

If the proper varieties of flower seeds are planted, you can have blooms all summer until late autumn.

Our Extra-Fine Lawn Grass Mixture

“Good in Shade or Sunshine”

A well-kept lawn adds to the beauty and value of any residence, and a good stand of lawn grass can only be secured by using the right kind of seed, mixed in the proper proportions. Our Grass Seed Mixture is made up of fresh, unadulterated seeds, natural and foreign, and fancy White Dutch Clover, in such proportions as to insure a beautiful and permanent lawn. It is carefully analyzed to determine its purity and thoroughly tested as to germination. We know it will grow and give the greatest satisfaction.

Making the Lawn

While it is absolutely essential that good seed be used in the making of a lawn, there are other elements that enter in, such as the proper preparation of the soil and the absence of manure that contains weed seeds. The soil should be well dug and evenly raked, after which the grass seed should be sown by hand, half the quantity in one direction and half at right angles to it. The grass seed is more evenly distributed by sowing it in this manner. After seeding, rake thoroughly with a steel rake and roll the surface until packed down hard and smooth. Grass seed may be sown in early spring, after hard freezing is over, until as late as the middle of June, but not during hot, dry weather. It may again be sown from September 1st to the middle of October, or even later if the weather is warm and not too dry. For a thick, velvety sod, it is necessary to sow the seed thickly,—one quart to every 100 square feet is not too much.
